

## Persistent organic pollutants (POPs)

Persistent organic pollutants (POP) are organic substances that persists in the environment, accumulate in living organisms, and pose a threat to our health and the environment. They can be transported across international borders by air, water, or migratory species, and they can reach regions where they have never been produced or used. POPs are regulated worldwide by the Stockholm Convention and the Aarhus Protocol. This legislation is implemented in the European Union by the POPs Regulation. The POP Regulation aims to protect human health and the environment with specific control measures.

We hereby declare that, in accordance with Regulation (EU) 2019/2021, no persistent organic pollutants are present in JEAN MÜLLER products. The statement made here is essentially based on the information provided by the manufacturers and our suppliers.
